

Shown with Model 6555 Control Head

MODEL 6512 ELECTRONIC CONTROL BASE

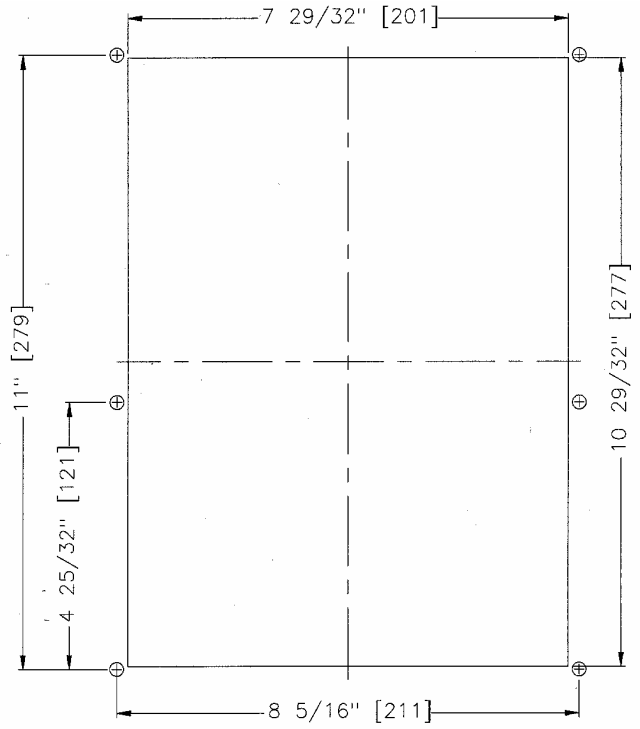

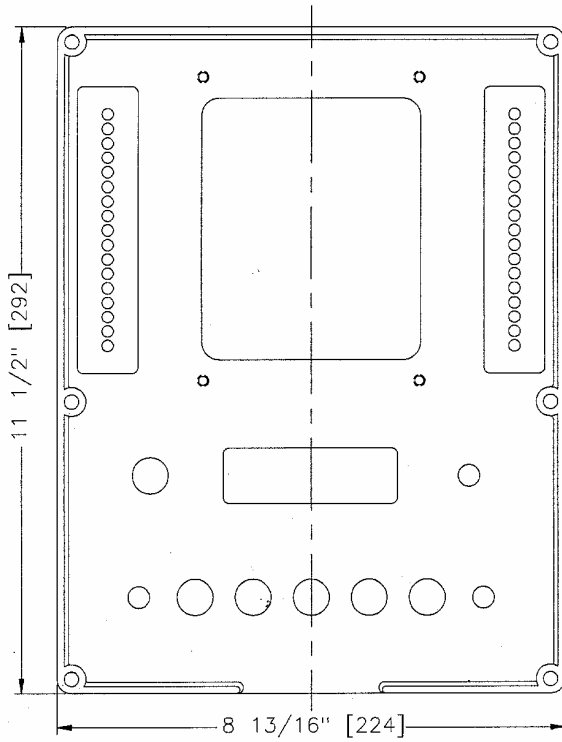

In response to customer requests, we now offer another electronic control base that works together with various control heads.

The basic control head that works with this control base is a model 6555 (as shown above) which is illuminated on either side of the control head. The LED strips indicate the actual running position of the propulsion machinery. In this way, the operator can match the control handles to the engine speed and direction before taking over the station. In the middle of the control assembly we have 4-line digital readout which will provide important

information from the propulsion machinery and the control system. A dimmer and a lamp test is provided, the switch (six as shown) can be made to customer requirements. We can provide up to 12 buttons for any shipboard function. The control assembly is intended for indoor use only.

Other control heads that can be integrated with the 6512 base are models 6515, 6523 and 6545. When ordering, please provide your requirements including the control head you would like to use on this base.
